STEEL HEART OF
THE KITCHEN

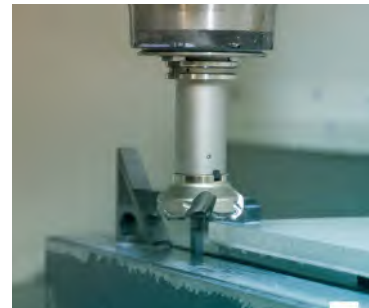

THE TECHNOLOGIES

When a steel sink is manufactured, use of high-end technology is ensured. At different stages of manufacturing, Laser Welding forms an integral part of these fabricated sinks. Our high-performance lasers are used to weld with accurate precision at the sink corners which gives us the flexibility to make the radius from 0 to 10 and also higher radiuses.

Laser cutting is one of the most important components of technology. Since the first cut decides the final product, we use the most advance and high-performance laser cutting machine. This helps in cutting with precision, which eventually helps for precision bending and punching.

On a 5-axis milling machine, we process advance tool forming moulds which ensures variety in all design formations for making jigs and fixtures.

Deep drawing is a sheet metal forming process in which a sheet metal blank is radially drawn into a forming die by the mechanical action of a punch. It is thus a shape transformation process with material retention. The process is considered "deep" drawing when the depth of the drawn part exceeds its diameter. This is achieved by redrawing the part through a series of dies.

STEELTECHNIK

A press brake is a machine pressing tool for bending sheet and plate material, most commonly sheet metal. It forms predetermined bends by clamping the work piece between a matching punch and die.

Laser marking is a non-contact printing method that marks or engraves high quality 1D or 2D bar barcodes, multiple lines of text, batch number, lot codes, logos etc. on various products for tracking and tracing purposes.

Laser welding operated by a robot is a highly precised computer controlled welding process which gives excellent seam surfaces even at high welding speeds.

PVD has comparatively high hardness compared to conventional stainless steel sinks, high scratch, abrasion and corrosive resistance. They also resist salts, acids and detergent products present in domestic environment. PVD sinks remain truly a green product because no harmful chemicals are released into the environment while making them. The sinks are 100% suitable for food use. With this technology different finishes like, rose gold, yellow gold, gun metal and other vintage finishes are achieved.

PVD COLLECTION

PVD Coating:

Introduction of PVD (Physical Vapour Deposition) technique for the first time in India to manufacture world class quality Stainless Steel sinks. PVD Coating refers to a variety of thin film deposition techniques where a solid material is vaporized in a vacuum environment and deposited on substrates as a pure material or alloy composition coating. We are the one of the few in the world who has established PVD plant for coating stainless sinks in different finishes like **Yellow Gold, Rose Gold and Gun Metal**.

These coatings can reduce friction and provide a barrier against damage and is often used where long lasting durability is crucial. Physical Vapor Deposition processes are an environmentally friendly or “plating” technique that greatly reduces the amount of toxic substances that must be used, manage and disposed of as compared to other “wet” processes that involve fluid precursors and chemical reactions used to achieve the same result.

Uses:

The surfaces of kitchen sinks manufactured from this process aesthetically look beautiful like new even after decades of usage. The state-of-the-art technology ensures the production of high quality surface, which are not only three times harder than the conventional sinks but more corrosion resistance. Wide variety of finishes can be manufactured. These surfaces are more scratch resistant and stay beautiful for a long time.
